

vit_small | recipe_actual=mixup — sink frequency per position (top) and the most (anti)correlated gate layer (bottom)

vit_small | recipe_actual=nomix — sink frequency per position (top) and the most (anti)correlated gate layer (bottom)

vit_base | recipe_actual=mixup — sink frequency per position (top) and the most (anti)correlated gate layer (bottom)

Address concentration as EXCESS over each map's finite-sample null, mean over repeats [canon map]
hatched = per-position relative standard error > 0.5 (mostly Monte-Carlo noise)
